Research Interests

My research focuses on **passive wearable therapeutics**: closed-loop wearable systems that sense and gently modulate human physiology to make healthcare effortless, intervening beyond conscious attention rather than adding daily tasks or reminders. More broadly, this work builds toward **implicit physiological augmentation** – using the body's own signals to expand human capability, not just treat what's wrong. I explore this approach through controlled experiments, deployment studies, and clinical trials spanning guided breathing, passive vibrotactile rehabilitation, and neuromodulation for appetite.
